

## FUNDAMENTALS OF THE LCC ENERGY FILTER

The energy efficiency classification system pursuant to Eurovent 4/21 is enabling users to compare the quality of filters with respect to their energy-related operating behaviour. In addition to assessing a given filter based on its energy efficiency, system operators are naturally also interested in its cost effectiveness. This in turn depends on the application, the prevailing dust concentration and the operating hours.

TROX has developed a Life Cycle Cost (LCC) tool in order to calculate the economic efficiency of fine dust filters. Customers are able to use their individual usage data in order to choose a filter which has the highest economic efficiency compared to other filters in terms of power consumption, services and service life.

The filter energy cost calculation is based exclusively on power consumption. Depending on filter selection, you can have an energy cost saving of over 60%.

Assumptions for the calculation

- The average cost of electricity: EUR 0.15 per kWh (industrial consumers, business electricity) (source Eurostat)
- Performance (6000 h/year) pursuant to Eurovent 4/21 (calculation method for the energy use related to air filters in general ventilation systems)
- Annual power consumption in kWh/year, assumed average value for the energy efficiency class according to classification pursuant to Eurovent RS 4/C/001-2015 (rating standard for the certification of air filters)

Within the period of one year, one pocket filter of filter class F7 according to EN779, using a volume flow rate of 100,000 m<sup>3</sup>/h, consumes EUR 8603.00 in energy efficiency class D and EUR 3309.00 in energy efficiency class A+. Changing the filters from energy efficiency class D to A+ results in an annual energy costs saving of 61% (EUR 5294.00).

## EXAMPLE CALCULATION:

The values listed below show the energy costs for the selected volume flow rate for pocket filters of filter class F7 according to EN779 within a period of one year as an example – using an assumed electricity price of EUR 0.15/kWh and a variety of energy efficiency classes. The annual power consumption is based on the average values of the energy efficiency classification pursuant to Eurovent 4/21.
